What stands out (this selection)

Computed from the current filters · observations, not conclusions

- **US01** carries the largest revenue share: $55.34M (27.3% of revenue in scope).
- Revenue is **$4.67M below budget** (2.4% of net budget) on 30,953 lines.
- Cost base is **$6.77M above budget** (4.3%) on 22,771 lines.
- Posted lines are 42.8% of all-status lines in this selection; the other statuses are excluded by provisional rule R6 — see *Gross Profit & Scenarios*.
- 112 entity × GL cells show a persistent one-sided deviation from budget (same-sign lines, ≥12 months, ≥90% one side, ≥3%).

Budget variance snapshot

All comparable lines · net variance = actual − budget on lines with a budget

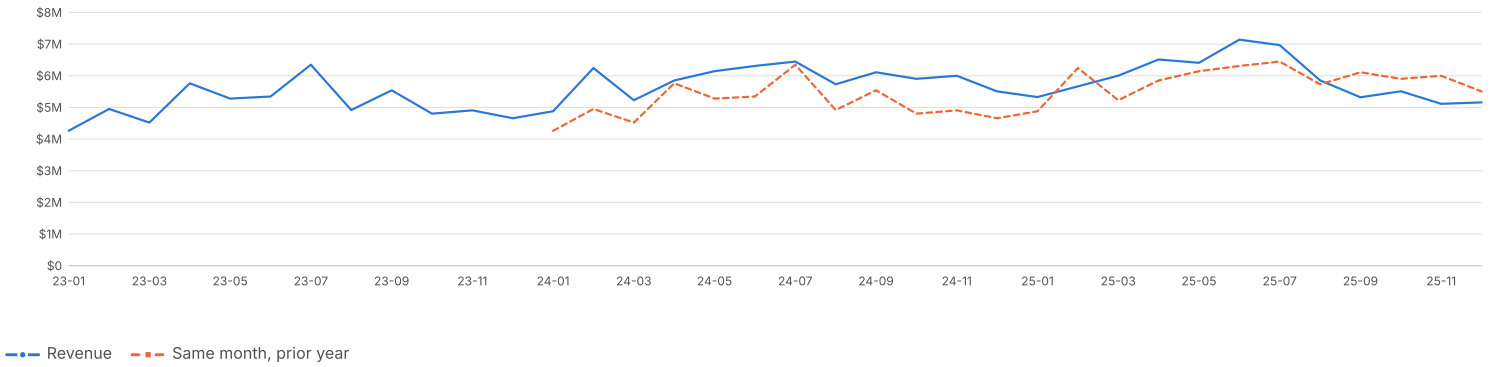

Section	Lines	Actual	Budget	Net variance	Var %	Gross cell var.
Revenue	30,953	$191.63M	$196.29M	−$4.67M	−2.4%	$29.64M
COGS	11,517	$87.56M	$82.76M	+$4.81M	+5.8%	$18.63M

Persistent one-sided deviations

filter-dependent

Rule (Phase 4 F5): same-sign lines, entity × GL cells with ≥12 months in scope, actual on the same side of budget in ≥90% of those months and |variance %| ≥3%. Persistence is a reason to investigate, not a cause.

112 of 144 cells with ≥12 months meet the rule in this selection. Overall portfolio (fixed, Phase 4 F5, all 36 months) 112 of 144 cells.

Entity	GL	Account	Months	Above / below	Dominant side %	Net variance	Var %

Sign-category profile (budget-bearing lines)

Where actual and budget have opposite signs the variance is dominated by sign handling, not by performance — whether those lines are defects or legitimate entries is unresolved (R9)

Sign category (actual vs budget)	Lines	% of lines	Net variance	|Variance| at line level	% of line-level |variance|
Same sign	48,700	88.5%	+$3.37M	$20.20M	14.4%
Opposite sign	6,267	11.4%	−$1.12M	$119.53M	85.3%
Zero involved	76	0.1%	+$24.0K	$330.8K	0.2%

The forecast column carries **no version or as-of date**, so it cannot be established that it was prepared before the actuals. These figures describe how close the forecast and budget columns are to actuals; **no forecast-skill claim is made**.

Three populations are shown separately and never mixed: **A — matched same-sign** (budget and forecast present, actual–budget and actual–forecast same sign); **B — comparable** (budget and forecast present, any sign; same lines for both measures); **C — all lines with a forecast** (no budget comparison). WAPE = Σ|forecast−actual| ÷ Σ|actual|; bias = Σ(forecast−actual) ÷ Σ|actual|.

Forecast and budget accuracy by population

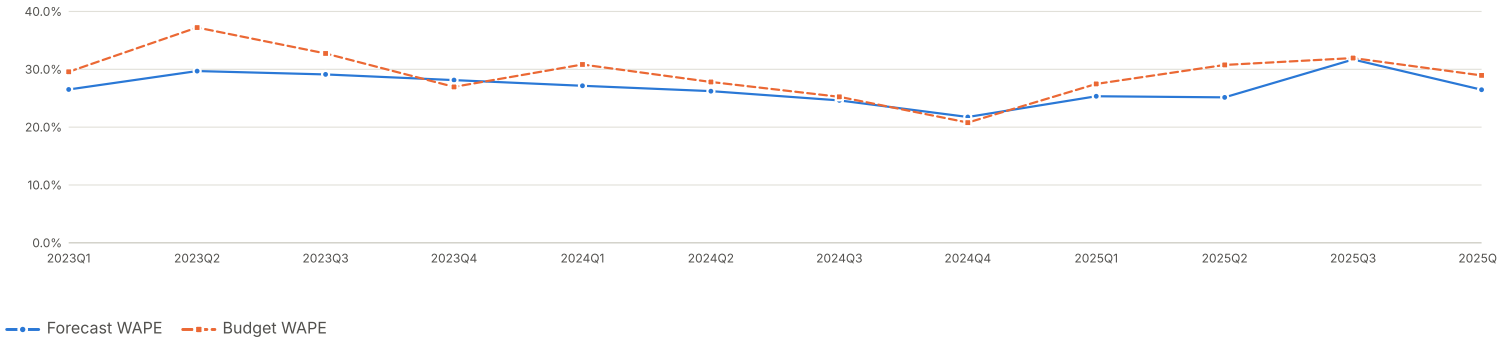

Current filters. Sample sizes are lines; a lower WAPE means a closer column, nothing more.

Cost centre (People + Opex), absolute USD

Lines without a cost centre are shown as (blank)

Salary per FTE (GL 6100)

Median |amount| ÷ headcount FTE by entity and year, and the share of lines within 0.5% of the entity median

Entity	Year	Lines	Median $/FTE	Within 0.5% of entity median
AE01	2023	46	$4800	100.0%
AE01	2024	59	$4800	98.3%
AE01	2025	49	$4800	100.0%
DE01	2023	52	$6400	98.1%
DE01	2024	61	$6400	100.0%
DE01	2025	55	$6400	100.0%
GB01	2023	54	$6100	98.1%
GB01	2024	72	$6100	95.8%
GB01	2025	53	$6100	98.1%

Overall: **98.4%** of 993 lines sit within 0.5% of their entity median rate. *Hypothesis, not a finding:* a near-constant rate looks like a standard or allocated rate rather than observed payroll; without a budgeted FTE plan the people-cost variance cannot be split into rate and volume.

Three gross-profit treatments of the discount account (GL 4190) are shown **side by side. None is chosen as authoritative**; the choice of discount treatment is an open policy question. Gross profit = revenue − COGS (signs as recorded, COGS as positive magnitude).

Gross profit by treatment

Row set: all rows · current filters

ROW SET: All rows

Treatment	Revenue	COGS	Gross profit	Gross margin
S1 - signed as recorded Revenue as recorded, including discount GL 4190 with its recorded sign.	$202.65M	$92.81M	$109.84M	54.2%
S2 - discount at -abs Discount GL 4190 forced to a negative magnitude (-|amount|) before summing.	$189.80M	$92.81M	$96.99M	51.1%
S3 - excluding discount Discount GL 4190 left out of revenue.	$205.18M	$92.81M	$112.37M	54.8%

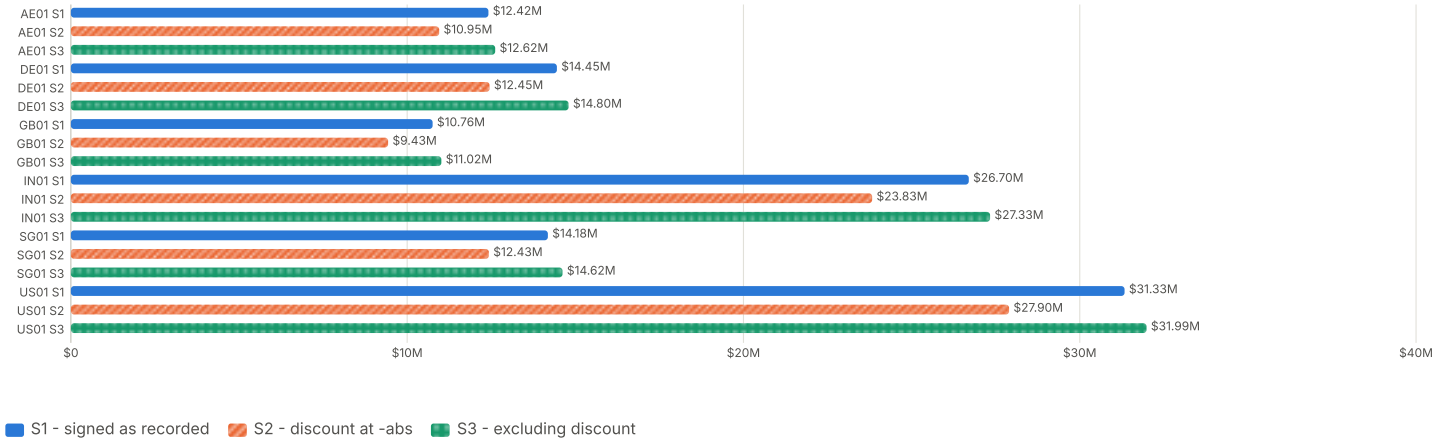

Gross margin by year

Gross profit ÷ revenue, per treatment

Gross profit by entity

USD per treatment (grouped as separate rows)

Gross profit vs budget — same-sign lines

Phase 4 E3 basis: revenue and COGS lines with a budget whose actual and budget share a sign; treatment applied to both actual and budget. Revenue effect = actual revenue − budget revenue; COGS effect = −(actual COGS − budget COGS). (Not affected by the Variance-population selector.)

Treatment	Actual GP	Budget GP	GP variance	Actual GM	Budget GM	Revenue effect	COGS effect	Lines
S1 - signed as recorded	$102.60M	$114.91M	−$12.32M	53.9%	58.2%	−$7.02M	−$5.30M	37,679
S2 - discount at -abs	$91.41M	$104.02M	−$12.61M	51.0%	55.8%	−$7.31M	−$5.30M	37,679
S3 - excluding discount	$105.07M	$117.33M	−$12.26M	54.5%	58.7%	−$6.96M	−$5.30M	37,679

Sensitivity of the headline to unresolved assumptions

Revenue, cost base (COGS+People+Opex) and result proxy under each scenario, one assumption changed at a time; **baseline** = Posted only, scale-adjusted, duplicate candidates retained, signs as recorded. These are sensitivities, not alternative "correct" answers. Status-partition rows are diagnostics, not reporting policies.

Status rows apply period, entity, division, section, GL, cost-centre and chart filters at line level, with baseline scale / duplicate / sign settings (the scenario selectors are deliberately not applied here: every row changes **one** assumption from the baseline). Scale, duplicate and sign rows apply the same dimension filters.

Factor	Scenario	Class	Lines	Revenue	Cost base	Result proxy	Δ revenue vs baseline	Δ result vs baseline
Journal status	Posted only (baseline)	BASELINE	58,340	$202.65M	$176.33M	$26.32M	–	–
Journal status	All except Rejected	POLICY	116,863	$404.38M	$355.23M	$49.16M	+$201.74M (+99.5%)	+$22.84M
Journal status	All statuses	POLICY	136,330	$471.58M	$417.70M	$53.88M	+$268.93M (+132.7%)	+$27.56M
Journal status	Pending only	DIAGNOSTIC	19,777	$67.57M	$57.89M	$9.68M	−$135.08M (−66.7%)	−$16.64M
Journal status	Parked only	DIAGNOSTIC	19,302	$67.04M	$61.73M	$5.31M	−$135.61M (−66.9%)	−$21.01M
Journal status	Rejected only	DIAGNOSTIC	19,467	$67.19M	$62.47M	$4.72M	−$135.46M (−66.8%)	−$21.59M
Journal status	(blank) only	DIAGNOSTIC	19,444	$67.13M	$59.28M	$7.85M	−$135.52M (−66.9%)	−$18.47M
Reporting scale	Adjusted, all (baseline)	BASELINE	58,340	$202.65M	$176.33M	$26.32M	–	–
Reporting scale	As reported (no restoration)	POLICY	58,340	$194.40M	$168.90M	$25.51M	−$8.25M (−4.1%)	−$813.3K
Reporting scale	Restore HIGH confidence only	POLICY	58,340	$200.88M	$171.44M	$29.44M	−$1.77M (−0.9%)	+$3.12M
Reporting scale	Exclude all restored rows	POLICY	55,966	$194.40M	$168.89M	$25.51M	−$8.25M (−4.1%)	−$813.6K
Reporting scale	Exclude MEDIUM-confidence restored	POLICY	56,746	$200.88M	$171.43M	$29.44M	−$1.77M (−0.9%)	+$3.13M
Duplicate candidates	Candidates retained (baseline)	BASELINE	58,340	$202.65M	$176.33M	$26.32M	–	–
Duplicate candidates	Exclude same-sign candidates	POLICY	57,977	$201.56M	$175.40M	$26.16M	−$1.09M (−0.5%)	−$164.1K
Duplicate candidates	Exclude all copy candidates	POLICY	57,742	$201.02M	$174.54M	$26.48M	−$1.63M (−0.8%)	+$157.9K
Sign handling	Signs as recorded (baseline)	BASELINE	58,340	$202.65M	$176.33M	$26.32M	–	–
Sign handling	All-non-negative rows only	POLICY	35,520	$171.90M	$160.28M	$11.62M	−$30.74M (−15.2%)	−$14.70M

Which assumption moves the headline most?

Range across baseline + policy scenarios of each factor, as % of that factor's baseline (diagnostics excluded)

Factor	Scenarios	Revenue range	Result range
Journal status	3	132.7%	104.7%
Reporting scale	5	4.1%	15.0%
Duplicate candidates	3	0.8%	1.2%
Sign handling	3	18.9%	55.8%

Two kinds of insight appear here and are labelled: **Current selection** insights are recalculated from the filters (and change with them); **Overall portfolio** insights are the fixed Phase 4 register entries (all 36 months, all entities, baseline rules) and do **not** change with filters. Observed facts, hypotheses and recommendations are kept apart; none implies a saving.

A · Insights for the current selection

filter-dependent

Revenue vs budget

Current selection

Revenue is $4.67M below budget on lines that carry a budget, 2.4% of |net budget|.

OBSERVED OBSERVATION	Revenue is $4.67M below budget on lines that carry a budget, 2.4% of |net budget|.
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; 30,953 revenue lines with a budget; population: All comparable lines.
MAGNITUDE & CALCULATION	Actual $191,627,865 − budget $196,293,772 = −$4.67M. Gross cell variance $29.64M (14.7% of cell budget), so offsetting cells hide a considerably larger underlying movement.
DRIVERS	Largest entity × GL cells: US01 4100 (−$1.33M); SG01 4100 (−$895.0K); DE01 4100 (−$803.1K) — together 55% of the cells' absolute net variance.
EVIDENCE	Row-level actual and budget amounts (Detail Lines tab); Phase 4 tables B1, B2, B6.
CONFIDENCE & ASSUMPTIONS	Medium. Arithmetic reconciles; meaning depends on unresolved rules: Posted-only status (R6), scale restoration (R7), sign convention (R9) and the budget version (unknown).
HYPOTHESIS	Hypothesis (not tested): budget phasing or price/volume assumptions differ from actual trading; part may reflect sign handling on opposite-sign lines.
ACTION RECOMMENDATION	Obtain the budget version/date and the revenue sign convention, then re-cut this variance by price vs volume where quantity data allow. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Budget methodology note; written definition of the revenue sign convention; confirmation of the status rule.
MONITORING	Track net variance % by section each close; alert when the direction or the gross/net ratio changes.

Cost base vs budget

Current selection

Cost base (COGS + People + Opex) is $6.77M above budget, 4.3% of |net budget|.

OBSERVED OBSERVATION	Cost base (COGS + People + Opex) is $6.77M above budget, 4.3% of |net budget|.
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; 22,771 cost lines with a budget; population: All comparable lines.
MAGNITUDE & CALCULATION	COGS +$4.81M + People +$39.4K + Opex +$1.92M = +$6.77M (actual $165,847,386 vs budget $159,076,523).
DRIVERS	Largest cells: IN01 5100 Materials (+$1.60M); DE01 5100 Materials (+$530.9K); SG01 5100 Materials (+$471.8K)
EVIDENCE	Phase 4 tables B1, B2, F1; Detail Lines.
CONFIDENCE & ASSUMPTIONS	Medium: same open rules as revenue; costs are positive magnitudes so a positive variance means actual above budget, not a judgement.
HYPOTHESIS	Hypothesis: a similar-sized percentage gap across COGS, People and Opex can point to a common budget-setting method (e.g. a uniform uplift) rather than line-specific causes — test by checking whether the ratio is uniform across accounts.
ACTION RECOMMENDATION	Ask the budget owner how the budget was built (top-down factor vs bottom-up) before attributing the gap to operations. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Budget build documentation; accrual/cut-off policy for Pending and Parked entries.
MONITORING	Monitor the cost-to-budget ratio by account; flag accounts whose ratio departs from the group ratio.

Persistence

Current selection

112 of 144 entity × GL cells (with ≥12 months) sit on the same side of budget in at least 90% of months with a variance of at least 3%.

OBSERVED OBSERVATION	112 of 144 entity × GL cells (with ≥12 months) sit on the same side of budget in at least 90% of months with a variance of at least 3%.
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; same-sign lines only (Phase 4 F5 rule); cells need ≥12 months inside the selected period.
MAGNITUDE & CALCULATION	Dominant-side share = max(months above, months below) ÷ months with data; |variance %| ≥ 3% of |net budget|.
DRIVERS	Largest by |variance|: US01 4100 (−$1.64M, below budget 36/36 months); IN01 4100 (−$1.37M, below budget 36/36 months); US01 5100 (+$1.01M, above budget 36/36 months)
EVIDENCE	Phase 4 F5/B6 tables; Budget & Variance tab.
CONFIDENCE & ASSUMPTIONS	Low to medium: persistence is consistent with a budget-level bias but is also what a systematic data or sign artefact would produce.
HYPOTHESIS	Hypothesis: a one-sided pattern in nearly every cell suggests a budget or data-generation convention rather than 36 independent operating shortfalls.
ACTION RECOMMENDATION	Review the persistent cells with the budget owner before any operational follow-up; start with the largest cells. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Budget version and basis; sign convention (R9).
MONITORING	Re-run the persistence rule each quarter; track the count and total variance of persistent cells.

Sign sensitivity Current selection

Revenue net variance is −$4.67M on all lines but −$7.02M on same-sign lines; opposite-sign lines contribute +$2.36M.

OBSERVED OBSERVATION	Revenue net variance is −$4.67M on all lines but −$7.02M on same-sign lines; opposite-sign lines contribute +$2.36M.
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; revenue lines with a budget (all / same-sign / opposite-sign populations).
MAGNITUDE & CALCULATION	All-lines net variance − same-sign − opposite-sign − zero-involved = bridge (Phase 4 B8 reconciles to 0.00).
DRIVERS	3,366 opposite-sign revenue lines out of 30,953 (10.9%).
EVIDENCE	Phase 4 B7/B8; Budget & Variance sign table.
CONFIDENCE & ASSUMPTIONS	Medium: arithmetic exact; whether opposite-sign lines are defects or legitimate (credit notes, reversals) is unresolved.
HYPOTHESIS	Hypothesis: some opposite-sign lines are sign-convention artefacts; others may be genuine reversals.
ACTION RECOMMENDATION	Classify a sample of opposite-sign lines with the ledger owner and decide a documented treatment. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Sign-convention definition (R9); reversal/credit-note flags.
MONITORING	Track the share of opposite-sign lines per close.

Forecast vs budget Current selection

Revenue forecast WAPE is 2.59% vs budget 3.67% on the matched same-sign subset (A, 24,372 lines), but 26.8% vs 29.3% on all comparable lines (B, 29,131); all forecast lines (C, 30,879): 26.6%.

OBSERVED OBSERVATION	Revenue forecast WAPE is 2.59% vs budget 3.67% on the matched same-sign subset (A, 24,372 lines), but 26.8% vs 29.3% on all comparable lines (B, 29,131); all forecast lines (C, 30,879): 26.6%.
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; revenue; three populations kept separate.
MAGNITUDE & CALCULATION	WAPE = Σ|forecast − actual| ÷ Σ|actual| (budget column the same way on the same lines).
DRIVERS	Lines with opposite-sign forecast carry 91.2% of absolute revenue forecast error in this selection.
EVIDENCE	Phase 4 C1, C6, C2; Forecast tab.
CONFIDENCE & ASSUMPTIONS	Low for any general claim: the forecast has no version or as-of date, and the matched subset excludes the lines that drive most of the error.
HYPOTHESIS	Hypothesis: the forecast column may be derived from or revised after actuals; not testable from the extract.
ACTION RECOMMENDATION	Do not use forecast accuracy as evidence of skill until the forecast version/timing is documented. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Forecast version and as-of date per row.
MONITORING	Once versioned, track WAPE and bias by quarter on a fixed comparable population.

Cost concentration Current selection

5100 Materials is the largest cost account at 36.8% of the cost population; the top three accounts hold 59.0% (HHI 0.180 vs equal-share 0.059).

OBSERVED OBSERVATION	5100 Materials is the largest cost account at 36.8% of the cost population; the top three accounts hold 59.0% (HHI 0.180 vs equal-share 0.059).
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; COGS, People, Opex and D&A on absolute amounts.
MAGNITUDE & CALCULATION	Share = |GL amount| ÷ Σ|cost amounts|; HHI = Σshare².
DRIVERS	See Drivers & Concentration for the ranked list and entity/division/cost-centre concentration.
EVIDENCE	Phase 4 F1, F2.
CONFIDENCE & ASSUMPTIONS	High on the arithmetic; low on any cost-driver interpretation.
HYPOTHESIS	Hypothesis: concentration points to where a cost review would have the most leverage; no saving is implied.
ACTION RECOMMENDATION	Prioritise any cost-review effort on the highest-share accounts after confirming the data basis; observed variance is not a saving. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Account-level cost owners and contract/volume data.
MONITORING	Track top-3 share and HHI by quarter.

Journal status Current selection

Posted lines are 42.8% of all-status lines and 43.0% of all-status revenue in this selection; other statuses: Pending 14.5%, Parked 14.2%, Rejected 14.3%, (blank) 14.3% of lines.

OBSERVED OBSERVATION	Posted lines are 42.8% of all-status lines and 43.0% of all-status revenue in this selection; other statuses: Pending 14.5%, Parked 14.2%, Rejected 14.3%, (blank) 14.3% of lines.
PERIOD & POPULATION	Jan 23 – Dec 25; 58,340 Posted lines; all-status line-level population (separate from the Posted-only dashboard population) with every filter and the selected scale/duplicate/sign scenarios applied.
MAGNITUDE & CALCULATION	Posted revenue $202.65M vs all-status revenue $471.58M.
DRIVERS	Pending, Parked, Rejected and blank statuses are excluded by provisional rule R6.
EVIDENCE	Phase 4 I1/I2, INS-01.
CONFIDENCE & ASSUMPTIONS	High that the dependency exists; low on which status rule is right.
HYPOTHESIS	Hypothesis: status may be assigned independently of line size or section; not testable from the extract.
ACTION RECOMMENDATION	Present headline figures as a range until the status definitions are documented. *(No saving is implied by an observed variance.)*
EVIDENCE NEEDED	Written definitions of Posted/Pending/Parked/Rejected/blank and the extract cut-off.
MONITORING	Track the Posted share of lines each close.

B · Phase 4 insight register

fixed · overall portfolio

Score 1–3 per axis (convention of this project, not a standard)

Rank	ID	Insight	Mat.	Pers.	Conf.	Act.	Total
1	INS-01	The journal-status rule is the largest swing factor in the revenue and result headlines among the four assumptions tested (status, scale, sign, duplicates)	3	3	2	3	11
2	INS-02	Lines whose forecast and actual have opposite signs (10% to 13% of lines) carry 89% to 91% of the absolute forecast error; whether they are data defects or legitimate entries is unresolved	3	3	2	3	11
3	INS-03	Actuals sit a near-constant 3.6% below budget on revenue and 6.4% above budget on costs on same-sign lines in all 36 months, all 6 entities, all 5 divisions and every one of the 20 operating accounts (the all-lines view differs)	3	3	2	2	10
4	INS-04	Gross profit is $12.3M below budget on same-sign lines: 57% of the gap is revenue below budget and 43% is COGS above budget; the margin gap holds under all three discount treatments	3	3	2	2	10
5	INS-05	On a matched same-sign subset the forecast is closer to actuals than the budget; on all comparable lines the margin is 26.8% vs 29.3% revenue WAPE (forecast vs budget) and reverses for people costs, and neither view establishes forecast skill	2	3	2	3	10
6	INS-06	Salary lines carry a near-constant rate per FTE within each entity; without a budgeted FTE plan and the budget's rate method, the people-cost variance cannot be split into rate and volume	2	3	2	3	10
7	INS-07	Scale restoration moves the result proxy by $3.1M, and the larger (MEDIUM-confidence) tier cannot be verified against price	2	2	2	3	9

INS-01 · The journal-status rule is the largest swing factor in the revenue and result headlines among the four assumptions tested (status, scale, sign, duplicates) Overall portfolio finding — fixed

HEADLINE	The journal-status rule is the largest swing factor in the revenue and result headlines among the four assumptions tested (status, scale, sign, duplicates).
BUSINESS QUESTION	How much of the reported revenue, cost and result depends on which journal statuses are counted?
POPULATION AND PERIOD	P&L lines passing every gate except the status gate: 136,330 lines, Jan 2023 - Dec 2025. Baseline (provisional rule R6) = Posted only: 58,340 lines (42.8%).
METRIC DEFINITION	Revenue = REVENUE section; cost = COGS + PEOPLE + OPEX; result proxy = revenue - cost (not a reported operating profit; D&A, below-EBITDA and tax excluded). USD, scale-adjusted (provisional), signs as recorded. Two kinds of scenario are kept apart: REPORTING-POLICY scenarios (Posted only = baseline, all except Rejected, all statuses) are the comparable alternatives that the swing ranking uses; STATUS-PARTITION diagnostics (Pending, Parked, Rejected and blank on their own) only show how the any-status population splits and are not alternative reporting policies.
QUANTIFIED RESULT (OBSERVED FACT)	Policy scenarios: revenue $202.65M (Posted only, baseline) vs $404.38M (all except Rejected) vs $471.58M (all statuses); result proxy $26.32M vs $49.16M vs $53.88M. Across these 3 policy scenarios the revenue headline moves by 133% of the baseline and the result proxy by 105%; the corresponding ranges for the scale, duplicate and sign factors (each over its own policy scenarios and baseline) are 4%, 1% and 19% of revenue. Partition diagnostic: the four non-Posted statuses hold near-equal volumes of lines (19,777, 19,302, 19,467, 19,444 for Pending, Parked, Rejected, blank) and of revenue ($67.6M, $67.0M, $67.2M, $67.1M); Posted holds 58,340 lines (42.8%, about three times any other status) and $202.6M.
DRIVER DECOMPOSITION	**Reporting-policy scenarios (ranked)**

Scenario	Class	Lines	Revenue	Cost	Result proxy
POSTED_ONLY (baseline)	BASELINE	58,340	$202.65M	$176.33M	$26.32M
ALL_EXCEPT_REJECTED	POLICY_SCENARIO	116,863	$404.38M	$355.23M	$49.16M
ALL_STATUSES	POLICY_SCENARIO	136,330	$471.58M	$417.70M	$53.88M

Status-partition diagnostics (not ranked; the five statuses add up to the all-status population)

Scenario	Class	Lines	Revenue	Cost	Result proxy
POSTED_ONLY (baseline)	BASELINE	58,340	$202.65M	$176.33M	$26.32M
PENDING_ONLY	STATUS_PARTITION_DIAGNOSTIC	19,777	$67.57M	$57.89M	$9.68M
PARKED_ONLY	STATUS_PARTITION_DIAGNOSTIC	19,302	$67.04M	$61.73M	$5.31M
REJECTED_ONLY	STATUS_PARTITION_DIAGNOSTIC	19,467	$67.19M	$62.47M	$4.72M
BLANK_ONLY	STATUS_PARTITION_DIAGNOSTIC	19,444	$67.13M	$59.28M	$7.85M

VALIDATION EVIDENCE	Single-status buckets partition the any-status population exactly (checks I03, I04); scenario classes are validated (I13-I15: the ranking uses only baseline + policy scenarios); all 15 scenarios recomputed in pandas from the CSV (cross-check X8xx) and the status range recomputed independently (X98_REV); Posted subset equals the eligible flag (L27).
INTERPRETATION	The split is almost exactly 3:1:1:1:1 (Posted = 42.8% of lines against 3/7 = 42.9%), and each non-Posted status carries about the same revenue, so status shows no visible link to line size or section. A genuine workflow would normally leave a Posted majority with small Pending/Parked tails and few Rejected lines. Whether Rejected lines belong in the books, and whether Parked/Pending are accruals or cut-off items, decides which of several very different P&Ls is 'the' P&L. The ranking measures how far each unresolved assumption can move the headline under the policies defined here; it is a sensitivity, not an estimate of error, and the ranges of different factors are not strictly like-for-like because each factor has its own baseline and its own set of policies.
ALTERNATIVE EXPLANATIONS	(a) The extract is a union of several scenarios or versions that were all labelled by status by accident. (b) Status is assigned at random in the generator (the dataset is synthetic - provenance unverified). (c) Posting really is 43% complete at the extract date, in which case the all-status view overstates. None can be tested from the file.
CONFIDENCE AND LIMITATIONS	High that the dependency exists (arithmetic, reconciled). Low on which scenario is right: it needs the business definition of each status; the official journal-status rule is not chosen here. Limitation: the proxy omits D&A, below-EBITDA and tax.
RECOMMENDATION (ACTION)	Before any report is published, obtain written definitions for Posted, Pending, Parked, Rejected and blank, and the cut-off rule for the extract. Until then show headline figures as a range (Posted-only to all-except-Rejected), never a point estimate.
EXPECTED IMPACT	No saving is implied, and this sizes the exposure only: it does not show which journal-status policy is correct. The exposure is reporting error: a point estimate on the Posted-only rule could understate revenue by $202M (all statuses except Rejected) up to $269M (all statuses) over 3 years and all entities (observed differences) if the other statuses belong in the books.
OWNER, FOLLOW-UP, KPI	Controller / close owner (status definitions); FP&A lead (range presentation). KPI: share of lines with a documented status definition = 100%; share of period-end lines not Posted.
MONITORING METHOD	Re-run out_i1/out_i2 each close; alert when the Posted share of any-status lines (out_g1: posted_rows / any_rows) leaves the range observed over the 36 months.

INS-02 · Lines whose forecast and actual have opposite signs (10% to 13% of lines) carry 89% to 91% of the absolute forecast error; whether they are data defects or legitimate entries is unresolved

Overall portfolio finding — fixed

HEADLINE	Lines whose forecast and actual have opposite signs (10% to 13% of lines) carry 89% to 91% of the absolute forecast error; whether they are data defects or legitimate entries is unresolved.
BUSINESS QUESTION	What drives the large forecast error, and what remains unresolved about it?
POPULATION AND PERIOD	Eligible P&L lines with a forecast value: 53,543 (four operating sections).
METRIC DEFINITION	Forecast error = Forecast - Actual. WAPE = sum|F-A| / sum|A|. Bias = sum(F-A) / sum|A|. Sign category of each (actual, forecast) pair: SAME_SIGN_NONZERO, OPPOSITE_SIGN_NONZERO (both non-zero, different signs), ZERO_INVOLVED (either amount is exactly 0) and MISSING_OR_UNAVAILABLE (empty here by construction). An opposite-sign pair is an observation, not a confirmed accounting error. No sign is flipped anywhere.
QUANTIFIED RESULT (OBSERVED FACT)	WAPE on all lines (scale-adjusted amounts, signs as recorded): revenue 26.6%, COGS 27.0%, people 29.3%, opex 27.9%. On same-sign non-zero lines only: 2.6%, 3.4%, 3.4%, 3.4%. 10.5% of revenue lines are opposite-sign but they carry 91.2% of the absolute revenue forecast error (total absolute revenue forecast error $63.93M); zero-involved lines carry 0.2% or less in every section. The shares come from the explicit four-category rule and are recomputed independently in pandas (X97).

DRIVER DECOMPOSITION

Section	Opposite-sign lines (share of lines)	Opposite-sign share of abs error	Same-sign share of abs error	Zero-involved share of abs error	WAPE all lines
REVENUE	10.5%	91.2%	8.6%	0.21%	26.6%
COGS	12.1%	88.6%	11.1%	0.24%	27.0%
PEOPLE	13.2%	89.9%	10.0%	0.11%	29.3%
OPEX	13.1%	89.1%	10.7%	0.23%	27.9%

VALIDATION EVIDENCE	Category shares of rows and of error each sum to 1 and error attribution reconciles to total absolute error (C06, C07); the opposite-sign share is recomputed from fact_close (C09) and with the independent pandas category rule (X97); category counts for budget, forecast and prior year are recounted in pandas (X96); WAPE and bias recomputed in pandas (X30-X32). Variance bridge: all lines = same-sign + opposite-sign + zero-involved with difference 0.00 (B08).
INTERPRETATION	Observed (arithmetic): on all lines the forecast error is large; restricted to same-sign non-zero lines it is small. Concentration of error: opposite-sign lines (an association in this extract; no cause is established). The same category accounts for the difference between the all-lines and same-sign budget variances: people-cost variance is $0.04M on all lines but $2.29M on same-sign lines (opposite-sign lines contribute -$2.26M); revenue variance moves from -$4.67M to -$7.02M. Among eligible lines, 21.8% are flagged by the Phase 3 sign-pattern rule as a single-column sign flip (24.0% of absolute value) and 10.7% have local and USD amounts of opposite sign (a flag, not proof). Caution: the same-sign WAPE is a sensitivity chosen by the outcome (a line is kept because actual and forecast agree in sign, which mechanically removes the largest errors); it is not a measure of forecast skill. Unresolved (accounting): whether an opposite-sign pair is an error or a legitimate reversal, credit note or contra-account entry depends on the account-level sign convention, which is not verified (R9). Next investigation: take a sample of opposite-sign lines per account and compare them with source documents; ask the ledger owner for the sign convention by account.
ALTERNATIVE EXPLANATIONS	(a) Some opposite-sign lines are legitimate credit notes, reversals or reclassifications - not testable without the sign convention (the sign convention is an unresolved Phase 1 rule, R9). (b) If the data were generated synthetically, sign inversions may have been injected independently per column, which would explain why differences appear in exactly one of the amount columns. (c) The forecast may be a late re-forecast (no version or as-of date exists), which changes what the error means.
CONFIDENCE AND LIMITATIONS	High on the arithmetic and on its independent recomputation. Low on the accounting interpretation: no validated sign convention exists. Forecast skill is neither proved nor disproved, because the extract has no forecast version or as-of date.
RECOMMENDATION (ACTION)	Do not report forecast accuracy from this extract. Investigate the opposite-sign lines by account against source documents and obtain the account-level sign convention (contra accounts such as 4190, reversal postings, credit notes). Only after the conventions are verified, decide whether a validation rule is needed; do not impose a universal 'actual, budget and forecast must share a sign' rule before then.
EXPECTED IMPACT	Measurement exposure, not a saving. Opposite-sign lines contribute $2.36M to the net revenue variance and -$2.26M to the net people-cost variance (observed, scale-adjusted amounts, signs as recorded).
OWNER, FOLLOW-UP, KPI	Data owner of the source ledger extract; FP&A analytics. KPI (monitoring statistic, not a defect rate): share of lines with opposite-sign actual and forecast (currently 10.5% of revenue lines).
MONITORING METHOD	Each close: count of opposite-sign lines by account (out_b7, out_c2); investigate when a new account appears or the share moves outside the observed range.

INS-03 · Actuals sit a near-constant 3.6% below budget on revenue and 6.4% above budget on costs on same-sign lines in all 36 months, all 6 entities, all 5 divisions and every one of the 20 operating accounts (the all-lines view differs) Overall portfolio finding — fixed

HEADLINE	Actuals sit a near-constant 3.6% below budget on revenue and 6.4% above budget on costs on same-sign lines in all 36 months, all 6 entities, all 5 divisions and every one of the 20 operating accounts (the all-lines view differs).
BUSINESS QUESTION	Where, and in which months, do actuals deviate from budget, and is the deviation concentrated anywhere?
POPULATION AND PERIOD	Eligible lines with a budget value: 55,043; analysis on lines where actual and budget are both non-zero with the same sign (same-sign view), with the all-lines view (scale-adjusted amounts, signs as recorded) shown beside it.
METRIC DEFINITION	Variance = Actual - Budget (USD). % = variance / ABS(net budget), published only when |net budget| >= 50% of gross budget (project convention; otherwise NULL). Net and gross shown. Revenue: negative = below budget. Costs are positive magnitudes: positive variance = spend above budget. No favourable/unfavourable label is attached.
QUANTIFIED RESULT (OBSERVED FACT)	Revenue -$7.02M (-3.6%); COGS $5.30M (+6.4%); people $2.29M (+6.4%); opex $2.50M (+6.4%). The monthly % is on the same side of budget in 36 of 36 months for revenue (below) and 36 of 36 for COGS, 36 of 36 for people and 36 of 36 for opex (above), with a monthly standard deviation of only 0.16, 0.37, 0.53 and 0.33 percentage points (revenue, COGS, people, opex). On all lines (no sign filter) the variances are -2.4%, +5.8%, +0.1% and +4.9%. Same-side check on same-sign lines (revenue below budget, costs above): revenue 36/36 months, 6/6 entities, 5/5 divisions, 4/4 GL accounts; cogs 36/36 months, 6/6 entities, 5/5 divisions, 5/5 GL accounts; people 36/36 months, 6/6 entities, 5/5 divisions, 3/3 GL accounts; opex 36/36 months, 6/6 entities, 5/5 divisions, 8/8 GL accounts. The claim is limited to the four operating sections on same-sign lines; D&A, below-EBITDA and tax are not covered and the all-lines view does not show it.

DRIVER DECOMPOSITION

Section	Cells (entity x GL, >=100 lines)	Lowest cell %	Highest cell %	SD of cell % (points)	Division range	GL range (all lines of the GL)
REVENUE	18	-3.6%	-3.3%	0.08	-3.6% to -3.5%	-3.5% to -2.5%
COGS	6	+6.3%	+6.6%	0.09	+6.2% to +6.6%	+5.8% to +6.5%
PEOPLE	18	+5.9%	+6.7%	0.21	+6.2% to +6.8%	+6.4% to +6.4%
OPEX	48	+5.9%	+7.1%	0.27	+6.3% to +6.8%	+6.2% to +6.6%

VALIDATION EVIDENCE	Variance recomputed per section in pandas (X20/X21) and in SQL (B01-B05); entity x GL, division and month tables each reconcile to the section totals (B09-B11); net-budget guard checked (B13); the top-10 cells overlap 8 of 10 between the all-lines and same-sign views (row_number with a tie-break gives exactly ten cells).
INTERPRETATION	A real operating deviation would differ by entity, product or month. This one does not: the cells sit within about one percentage point of the same figure per section (the discount account 4190 is the only visible exception, see the GL range) and the pattern repeats in all 36 months. That is what a top-down percentage adjustment of the budget (or a budget derived from actuals by a fixed factor) produces. It is an observation about the pattern, not a finding about operations.
ALTERNATIVE EXPLANATIONS	(a) Synthetic data: budget is generated as actual x a section factor. (b) Budgets were genuinely set top-down, e.g. +3.7% revenue ambition and -6% cost reduction targets applied uniformly. (c) Budget was re-based on actuals after the fact. The file cannot separate these.
CONFIDENCE AND LIMITATIONS	High on the numbers; Medium-Low on any business reading. Limitation: the same-sign filter removes 11% to 13% of the lines of a section (opposite-sign and zero-involved lines); the budget field has no version or approval date.
RECOMMENDATION (ACTION)	Do not assign variance to entities or accounts from this pattern: there is nothing to rank. Ask the budget owner how the budget was built (top-down factor or bottom-up) and its version history. If it was top-down, the useful action is a driver-based re-forecast of revenue and cost for the entities with the largest absolute exposure, listed in the driver table.
EXPECTED IMPACT	Observed, not a saving: over 3 years the same-sign revenue is $7.02M below budget and cost is $10.09M above budget on Posted lines only. A uniform gap implies a calibration issue in the plan, so closing it is a planning question; no cost can be 'recovered' from this table.
OWNER, FOLLOW-UP, KPI	Head of FP&A (budget method); budget owner. KPI: dispersion (SD) of variance % across entity x GL cells - a value near zero flags a mechanical budget.
MONITORING METHOD	Quarterly: recompute out_b2 and out_b5; investigate when the cell dispersion rises (a real operating difference emerging) or the monthly % crosses sides.

INS-04 · Gross profit is $12.3M below budget on same-sign lines: 57% of the gap is revenue below budget and 43% is COGS above budget; the margin gap holds under all three discount treatments

Overall portfolio finding — fixed

HEADLINE	Gross profit is $12.3M below budget on same-sign lines: 57% of the gap is revenue below budget and 43% is COGS above budget; the margin gap holds under all three discount treatments.
BUSINESS QUESTION	How far is gross profit from budget and which side explains it?
POPULATION AND PERIOD	Eligible lines with a budget where actual and budget are both non-zero with the same sign, revenue + COGS sections only (GL 4100-4190, 5100-5300). Revenue and COGS variances are each measured on their own section's same-sign lines (different line sets), so the gap is the published revenue variance minus the published COGS variance (reconciled to 0.00), not a like-for-like match of individual lines.
METRIC DEFINITION	Gross profit = revenue - COGS. The discount account 4190 is negative on 58% of its eligible lines, so three treatments are shown: S1 signed as recorded, S2 discount at absolute value, S3 excluding discounts. Margin % = GP / revenue.
QUANTIFIED RESULT (OBSERVED FACT)	GP variance -$12.32M (S1), -$12.61M (S2), -$12.26M (S3). Actual margin 53.9% vs budget 58.2% (S1); S2 51.0% vs 55.8%; S3 54.5% vs 58.7%. Revenue explains 57% of the S1 gap (-$7.02M), COGS 43% ($5.30M).

DRIVER DECOMPOSITION

Treatment	Actual margin	Budget margin	Margin gap (points)	GP variance	Revenue variance	COGS variance
GP_S1_SIGNED_AS_RECORDED	53.9%	58.2%	-4.3	-$12.32M	-$7.02M	$5.30M
GP_S2_DISCOUNT_ABS	51.0%	55.8%	-4.8	-$12.61M	-$7.31M	$5.30M
GP_S3_EXCL_DISCOUNT	54.5%	58.7%	-4.2	-$12.26M	-$6.96M	$5.30M

VALIDATION EVIDENCE	Bridge GP variance = revenue variance - COGS variance closes to 0.00 for all treatments (E01); GP recomputed from the CSV in pandas for S1, S2 and S3 (X50-X52); account classification of 4100/4110/4120/4190 verified (E06).
INTERPRETATION	The margin level depends on the row set: all lines give 54.2%, rows with sign_flag ALL_NON_NEGATIVE (no available amount negative; not a sign-consistent population) give 51.0% (S1, actuals only). The gap to budget is measured on same-sign lines, where it stays between -4.8 and -4.2 points across the discount treatments. Because the revenue gap and the cost gap are each uniform (INS-03), the margin gap looks like a plan-calibration effect on both sides rather than a mix or price effect.
ALTERNATIVE EXPLANATIONS	Price/volume/mix cannot be separated: the materials unit value equals the sales unit value for every product family (rejected finding R2 in the analysis report), so product-level unit economics are not usable. COGS sign mixing (5120 purchase price variance, mixed signs) could shift the COGS side.
CONFIDENCE AND LIMITATIONS	Medium. Level of margin: low (row-set dependent). Direction and size of the gap: medium-high.
RECOMMENDATION (ACTION)	Report gross margin only as a range with its treatment named. Ask the revenue accounting owner for the sign convention of 4190 and 5120. Re-base the GM% budget once the plan method is confirmed (INS-03).
EXPECTED IMPACT	Observed over 3 years on Posted same-sign lines: $12.32M below budget. This is a variance, not an addressable saving.
OWNER, FOLLOW-UP, KPI	Controller (4190/5120 convention); FP&A (GM% reporting). KPI: gross margin % vs budget with the treatment label.
MONITORING METHOD	Monthly: out_e3 (treatments side by side). Flag when treatments disagree on the sign of the gap.

INS-05 · On a matched same-sign subset the forecast is closer to actuals than the budget; on all comparable lines the margin is 26.8% vs 29.3% revenue WAPE (forecast vs budget) and reverses for people costs, and neither view establishes forecast skill Overall portfolio finding — fixed

HEADLINE	On a matched same-sign subset the forecast is closer to actuals than the budget; on all comparable lines the margin is 26.8% vs 29.3% revenue WAPE (forecast vs budget) and reverses for people costs, and neither view establishes forecast skill.
BUSINESS QUESTION	Is the forecast more reliable than the budget on comparable populations, and is its error random or systematic?
POPULATION AND PERIOD	Two populations, never mixed. (A) Matched same-sign subset: lines where actual, budget and forecast are all non-zero with the same sign (24,372 revenue lines) - chosen by outcome, so it removes the largest errors. (B) Comparable all-lines population: every eligible line with actual, budget and forecast present, any sign (29,131 revenue lines). The all-lines forecast population used in INS-02 (30,879 revenue lines) is larger because it does not require a budget.
METRIC DEFINITION	WAPE and bias as defined in INS-02. Bias > 0 = forecast above actual. Quarterly bias per section (12 quarters).
QUANTIFIED RESULT (OBSERVED FACT)	(A) Matched subset, revenue WAPE: forecast 2.6% vs budget 3.7% on 24,372 lines; COGS 3.4% vs 6.0%; people 3.3% vs 6.1%; opex 3.5% vs 6.1%. (B) Comparable all-lines population (any sign), WAPE forecast vs budget: revenue 26.8% vs 29.3% (29,131 lines); COGS 27.0% vs 29.2%; people 29.9% vs 29.0%; opex 28.0% vs 30.2%. Both measures are large on all lines (26.8% to 30.2%) because opposite-sign and zero-involved lines dominate the error; the matched-subset figures (2.6% to 6.1% for the four sections, forecast and budget) are small only because those lines are excluded. The forecast-minus-budget WAPE gap is -2.5 points for revenue, -2.2 COGS, +0.8 people and -2.2 opex (negative = forecast closer), so the ordering is not the same in every section. Revenue forecast is above actual in 12 of 12 quarters (bias +1.6%); COGS, people and opex are below actual in 12, 12 and 12 of 12 quarters (bias -2.5%, -2.5%, -2.5%). Result proxy on lines where actual, budget and forecast are all non-zero with the same sign over 3 years: actual $23.34M, forecast $30.80M, budget $38.35M.

DRIVER DECOMPOSITION

Year	Revenue (base)	Actual result	Forecast result	Budget result
2023	$50.56M	$4.88M	$7.19M	$9.49M
2024	$59.34M	$10.73M	$13.27M	$15.89M
2025	$58.65M	$7.73M	$10.33M	$12.97M
3 years	$168.55M	$23.34M	$30.80M	$38.35M

VALIDATION EVIDENCE	Per-quarter bias persistence from out_c5, recomputed WAPE/bias in pandas (X30-X32); forecast and budget compared on the same lines (C6).
INTERPRETATION	On the matched same-sign subset the forecast sits about halfway between budget and actual, with revenue above and costs below actual in every quarter, so its result proxy is about 32% above actual over 3 years (arithmetic on that subset; no favourable/unfavourable label is attached). The sample shows a directional difference between forecast and actual, and it appears on a subset selected by outcome. Whether that is a stable forecasting bias, a late re-forecast, or an artefact of how the extract was built cannot be established here: the extract has no forecast version or as-of date, so true forecast performance and any appropriate correction can only be determined with dated forecast snapshots and a back-test.
ALTERNATIVE EXPLANATIONS	No forecast version or date exists in the extract: the 'forecast' may be a late re-forecast that already knew part of the actuals, which would flatter its accuracy. The triple same-sign filter removes a large share of lines and selects lines by outcome.
CONFIDENCE AND LIMITATIONS	Medium for the arithmetic of each population; Low for any statement that the forecast is better than the budget in general: the populations give different margins, and the lack of version/timing prevents any conclusion about forecasting skill.
RECOMMENDATION (ACTION)	Obtain dated forecast snapshots (version and as-of date for each forecast). Only then back-test, on forecasts made before each period closed, whether the directional difference persists (observed in this sample: revenue +1.6%, COGS -2.5% of actual) and what adjustment, if any, would have improved WAPE. No correction is proposed from this extract.
EXPECTED IMPACT	None can be claimed from this extract. The size of any accuracy gain is unknown until a dated back-test is run; the observed difference is not a saving.
OWNER, FOLLOW-UP, KPI	FP&A forecasting lead. KPI: quarterly forecast bias by section (target not set here; baseline = values above).
MONITORING METHOD	Once dated forecast snapshots exist: each quarter, publish forecast difference and WAPE on the same same-sign basis; flag two consecutive quarters on the same side.

INS-06 · Salary lines carry a near-constant rate per FTE within each entity; without a budgeted FTE plan and the budget's rate method, the people-cost variance cannot be split into rate and volume

Overall portfolio finding — fixed

HEADLINE	Salary lines carry a near-constant rate per FTE within each entity; without a budgeted FTE plan and the budget's rate method, the people-cost variance cannot be split into rate and volume.
BUSINESS QUESTION	Can the people-cost variance be attributed to pay rate or to headcount volume?
POPULATION AND PERIOD	Eligible salary lines (GL 6100) with a positive FTE value: 993 lines.
METRIC DEFINITION	Salary per FTE = |USD amount| / headcount_fte; share of lines within 0.5% of the entity median rate. Conditional scenario (explicit assumptions below): implied excess FTE-months = salary variance / entity rate.
QUANTIFIED RESULT (OBSERVED FACT)	Observed: 98.4% of lines are within 0.5% of the entity's median rate (lowest entity-year share 90.6%); the rates are AE01 4,800, DE01 6,400, GB01 6,100, IN01 2,200, SG01 5,200, US01 7,800 USD per FTE-month. Conditional scenario (assumes the budget used the same rate and the FTE field is complete): the same-sign salary variance would equal AE01 33, DE01 46, GB01 27, IN01 170, SG01 48, US01 49 excess FTE-months over 36 months, i.e. IN01 about 4.7 FTEs per month above plan.

DRIVER DECOMPOSITION

Entity	Rate per FTE-month (USD)	Actual	Budget	Variance	Conditional: implied excess FTE-months	Conditional: average excess FTEs
AE01	4,800	$2.69M	$2.54M	$0.16M	33	0.9
DE01	6,400	$4.76M	$4.46M	$0.30M	46	1.3
GB01	6,100	$3.00M	$2.83M	$0.17M	27	0.8
IN01	2,200	$6.02M	$5.65M	$0.37M	170	4.7
SG01	5,200	$4.32M	$4.07M	$0.25M	48	1.3
US01	7,800	$6.33M	$5.94M	$0.38M	49	1.4

VALIDATION EVIDENCE	Median salary per FTE recomputed in pandas for IN01 2024 (X62); variance reconciles through entity x GL (B10). The FTE-month figures are arithmetic given the stated assumptions; they are not validated against any workforce plan.
INTERPRETATION	Observed fact: 98.4% of actual salary lines sit within 0.5% of the entity's median rate (lowest entity-year share 90.6%), which looks like an allocation or standard cost rather than observed payroll (hypothesis, not established). Neither a pay-rate effect nor a headcount effect is established or excluded by this extract. Hypothesis (not established): if the budget was built on the same rate, the variance would be a volume (headcount) effect. Rate versus volume cannot be separated without the budgeted FTE plan and the budget-rate method; a different budget rate would produce a rate variance. The same 6.4% overrun in each entity (INS-03) means this is not an IN01 problem: IN01 stands out in FTE terms only because its rate is the lowest.
ALTERNATIVE EXPLANATIONS	The budget may be built on a different rate or a different headcount; the FTE field is populated on 93% of the eligible salary lines; headcount_fte is an attribute of the journal line, not a payroll record.
CONFIDENCE AND LIMITATIONS	Medium for the rate pattern (data property); Low for the FTE-month figures (conditional on the stated assumptions).
RECOMMENDATION (ACTION)	Request the budgeted FTE plan by entity and month and the budget rate method. If they exist, compare actual FTE-months with plan directly instead of using dollars. Until then do not report either a pay-rate variance or a headcount variance for salaries from this extract.
EXPECTED IMPACT	Conditional scenario only: if the budget used the same rate, about 373 FTE-months were booked above plan in 3 years. The corresponding same-sign salary variance is $1.62M (observed, not a saving).
OWNER, FOLLOW-UP, KPI	HR business partner with FP&A. KPI: actual vs planned FTE-months by entity.
MONITORING METHOD	Monthly FTE-months vs plan; investigate if the standard rate in out_f6 moves by more than the observed spread.

INS-07 · Scale restoration moves the result proxy by $3.1M, and the larger (MEDIUM-confidence) tier cannot be verified against price Overall portfolio finding — fixed

HEADLINE	Scale restoration moves the result proxy by $3.1M, and the larger (MEDIUM-confidence) tier cannot be verified against price.
BUSINESS QUESTION	How much of the headline depends on the 6,265 scale restorations, and how well does evidence inside the extract support them?
POPULATION AND PERIOD	Eligible P&L lines: 2,374 are restorations (4.1%); 780 HIGH confidence (price identity), 1,594 MEDIUM (peer z-score).
METRIC DEFINITION	Restoration = amount x 1,000 or x 100,000 when the report-scale evidence says the value was divided. Scenarios use the same eligible lines. HIGH rows are tested against a leave-one-entity-out reference price (median unit value of UNDIVIDED HIGH lines of the same product family in the other five entities).
QUANTIFIED RESULT (OBSERVED FACT)	Revenue $202.65M adjusted vs $194.40M unadjusted (parsed) vs $200.88M restoring HIGH only. Result proxy $26.32M adjusted, $25.51M unadjusted (parsed), $29.44M HIGH only: restoring the MEDIUM tier lowers the result proxy by $3.12M because it adds more cost than revenue. Price test (all-status lines with a quantity and product family): HIGH 1/1000 restorations match the leave-one-entity-out reference price within 5% in 99% of 1,580 lines (93% within 0.5%); HIGH 1/100000: 92% within 5% of 234. Only 113 MEDIUM lines can be price-tested at all, and they match in 17% (1/1000) and 20% (1/100000) of cases.

DRIVER DECOMPOSITION

Scenario	Lines	Revenue	Cost	Result proxy
ADJUSTED_ALL (baseline)	58,340	$202.65M	$176.33M	$26.32M
RESTORE_HIGH_CONFIDENCE_ONLY	58,340	$200.88M	$171.44M	$29.44M
EXCLUDE_MEDIUM_CONFIDENCE_RESTORED	56,746	$200.88M	$171.43M	$29.44M
EXCLUDE_ALL_RESTORED_ROWS	55,966	$194.40M	$168.89M	$25.51M
AS_REPORTED_PARSED (no restoration)	58,340	$194.40M	$168.90M	$25.51M

VALIDATION EVIDENCE	adjusted = parsed x factor on every decided row (L42); scenario totals recomputed in pandas (X8xx); leave-one-entity-out count of HIGH 1/1000 lines within 5% recomputed in pandas (X95: 1,569 lines).
INTERPRETATION	The HIGH tier is consistent with a leave-one-entity-out reference price built without any line of its own entity (the reference is derived from the same extract, so this is internal consistency, not independent proof). The MEDIUM tier (71% of restorations) has no equivalent support, and where a price test is possible it mostly disagrees. Until that tier is validated, the adjusted totals stay provisional.
ALTERNATIVE EXPLANATIONS	MEDIUM rows may be lines for which a price test was impossible or was already failed when the tier was assigned (selection effect), so low match rates may reflect how they were chosen. The reference price is inferred from the same extract, so the test shows internal consistency, not a true price list; passing it does not make the adjusted amounts validated financial truth.
CONFIDENCE AND LIMITATIONS	High for the HIGH tier consistency; Low for the MEDIUM tier. Limitation: 73 lines remain undetermined and carry no adjusted value; the 72 P&L lines among them total $3,852 as reported, or $3.85M if all were 1/1000-scaled (a bound, not an estimate; out_i4).
RECOMMENDATION (ACTION)	Ask the source owner for the report-scale setting per extract batch to confirm the MEDIUM restorations directly; until confirmed, present both the HIGH-only and the full-restoration results.
EXPECTED IMPACT	Result proxy sensitivity $3.12M (12% of the baseline). Reporting exposure, not a saving.
OWNER, FOLLOW-UP, KPI	Data owner of the extract / cleaning lead. KPI: share of restored lines with source-confirmed scale.
MONITORING METHOD	Track restorations per extract batch; alert on any new MEDIUM restorations in a batch.

Data readiness gate: PASS with caveats

Source: cleaned extract of 152,682 rows → Phase 4 DuckDB; dashboard uses the 58,340 eligible P&L actual lines (Posted, valid entity/GL/period, scale decision made). Nothing was cleaned, deduplicated, imputed, dropped, re-signed or re-scaled by this dashboard.

- Row accounting from 152,682 source rows to 58,340 eligible lines is shown below (one primary exclusion reason per row).
- 55,043 eligible lines carry a budget; 136,330 lines pass every gate except the status gate.
- All 58,340 eligible lines are embedded; none is truncated or sampled.
- Material caveats: R6–R12 below are unresolved or provisional; source provenance and licence are unverified; the data is synthetic.

Baseline reconciliation to Phase 4 tables

459 / 459 checks passed

At **default filters** the dashboard recomputes these values from the embedded lines and compares them with the Phase 4 output tables embedded alongside; this is a baseline check and **not an independent reconciliation of any filtered view** (the header "Selection checks" badge is an internal consistency check of the current selection; the offline QA report holds the independent comparison). Tolerance: counts exact; USD within $0.01; ratios within 1e-9.

Group	Check	Dashboard	Phase 4 table	Result
Rows	Eligible P&L lines embedded	58,340	58,340	PASS
Rows	Lines in scope at default filters	58,340	58,340	PASS
Rows	Lines carrying a budget	55,043	55,043	PASS
I1 scenarios	duplicates / CANDIDATES_RETAINED (baseline) - lines	58,340	58,340	PASS
I1 scenarios	duplicates / CANDIDATES_RETAINED (baseline) - revenue	$202,649,002	$202,649,002	PASS
I1 scenarios	duplicates / CANDIDATES_RETAINED (baseline) - cost	$176,329,756	$176,329,756	PASS
I1 scenarios	duplicates / CANDIDATES_RETAINED (baseline) - result proxy	$26,319,246	$26,319,246	PASS
I1 scenarios	duplicates / EXCLUDE_ALL_COPY_CANDIDATES - lines	57,742	57,742	PASS
I1 scenarios	duplicates / EXCLUDE_ALL_COPY_CANDIDATES - revenue	$201,016,750	$201,016,750	PASS

Showing all failures first, then the first 12 passes. Full list: 459 checks across groups Rows, I1 scenarios, B1 variance, C1 forecast, C6 matched, Populations, E1 gross profit, E3 GP vs budget, D1 prior-year, F1 cost by GL, F2 concentration, F5 persistence.

Row accounting (all source rows)

Primary exclusion reason per row (Phase 4 I9)

Reason	Rows	% of rows
1_NON_POSTING_ROW	350	0.23%
2_JUNK_ENTITY	204	0.13%

Metric dictionary

Headline KPIs: Revenue, Cost base, Result proxy, Revenue vs budget, Cost base vs budget

Measure	Formula	Unit	Notes
Revenue	Σ actual_usd_adj, section REVENUE, Posted lines	USD (scale-adjusted, provisional)	Signs as recorded
Cost base	Σ actual_usd_adj, sections COGS + PEOPLE + OPEX	USD	Positive magnitudes
Result proxy	Revenue − cost base	USD	Not EBITDA; excludes D&A, below-EBITDA, tax
Variance	Actual − Budget on lines with a budget	USD	Positive = actual above budget; no favourable/unfavourable label
Variance %	Variance ÷ |net budget|, published only if |net budget| ≥ 50% of Σ|cell budget|	%	Phase 4 safe_pct
Gross cell variance	Σ |actual − budget| over entity × GL × month cells	USD	Shows what net variance nets away
WAPE	Σ|forecast − actual| ÷ Σ|actual|	%	Populations A/B/C kept separate; no skill claim
Bias	Σ(forecast − actual) ÷ Σ|actual|	%	
Gross profit	Revenue − COGS under treatments S1/S2/S3 (GL 4190 discount)	USD	No treatment chosen
Persistent deviation	Same-sign lines; entity × GL; ≥12 months; ≥90% one side; |var %| ≥ 3%	cells	Phase 4 F5
True YoY	Same calendar months, consecutive years, both in scope	%	Not the dataset prior-year column
HHI	Σ share² of absolute cost by member	0–1	Read against 1/N

Open assumptions

Not resolved by this dashboard

ID	Rule	Status
R6	Journal status: Posted only	Provisional
R7	Reporting scale: restore rows at 1E3/1E5 where evidence supports	Provisional
R8	FX direction (local ÷ rate vs ×)	Provisional
R9	Sign convention (is a positive cost an expense?)	Unresolved
R10	Variance % denominator rule	Provisional
R11	Duplicate candidates retained (not confirmed duplicates)	Unresolved
R12	Consolidation / intercompany elimination	Unresolved

Not shown (unsupported by the data)

- DSO, DPO, working capital (balance-sheet measurement basis unresolved)
- Month-end close duration / close-timeliness KPIs (no timestamps for close steps)
- Unit economics, forecast skill (no forecast version/as-of date)
- EBITDA (only a proxy is shown)

Item	SHA-256 / value
Cleaned CSV	`c184b677bacc6f23086e3b5eedd71836643cb75064e428a1ebfee4c075fa9b47`
Raw CSV	`a0e6eddde25280aa27a60c5955743d3243b14138d876eedac0547e24a1cc6fff`
Phase 4 database	`00e7437697c8e11baab5d2cff7036d6dda3d251a139774adee0a2dfe92c413e6`
Phase 5 workbook	`71e23dca9e0bbce3295223188c296cd3bd5ff51759825487bae049705375f561`
Embedded lines	58,340

Reconciliation to the Phase 5 workbook is performed by the offline QA script and reported in `DASHBOARD_QA_REPORT.md`.

Every line in the current selection, under the current scale basis. Click a column header to sort; search matches document, account, entity, division, period, cost centre or source row. “Export all filtered lines (CSV)” (top right) saves **all** rows matching the filters and search, in the current sort order. **Print / PDF prints the dashboard report; on this tab it prints only the rows of the current page** — it is not an export of all matching lines.

Rows 51–100 of 58,340 · page 2 of 1167

Synthetic, fictional group — provenance and licence of the source extract are unverified. Amounts are scale-adjusted provisional USD with signs as recorded; the sign convention (R9) is unresolved, so no figure here is labelled favourable or unfavourable. “Result proxy” = Revenue − COGS − People − Opex and is **not** EBITDA.
